

General Information about DiagnoseIS

DiagnoseIS is an interactive platform that supports (neuro-) psychological testing and test/assessment development. The software platform developed in close cooperation to several psychologists in both clinics and universities, handles all quantitative, statistical and objective aspects of the test, so that the test-assistant, psychologist or scientist can fully focus on qualitative aspects, observations and the client. Costly time is gained by the digital archives and automatically generated reports including graphs, drawings, comments regarding observations, results of measured cognitive functions and scores on applicable scales.

Digital Paper and Pencil

Using DiagnoseIS, the client performs a test without having the feeling to be working with a computer since the tests are displayed on a horizontal, flat tablet screen, using a special pen for drawing on the screen with virtual ink.

Acquire more: Product and Process

DiagnoseIS allows automated, accurate measurement of:

- coordinates (mm calibrated)
- drawing velocity and acceleration
- time and order of processing
- pen pressure
- correct/incorrect responses

Working together!

Although DiagnoseIS can be used in an offline environment, it also supports working together multisite, using an intranet or internet. Several universities, as well as some commercial companies, are currently developing new tests and experiments. This results in an online market place for measurement instruments, which we refer to as Metrisquare.

Report Generator

DiagnoseIS allows automatic generation of reports for clinical usage or import in SPSS or Excel. The report generator enables the user to generate reports on multiple patients or for routine outcome monitoring as well. Furthermore, the user can add text of images, or edit the automatically generated reports in a user friendly way.
